PRELIMINARY NOTE ON THE RELATION OF
DERMATITIS HERPETIFORMIS TO HERPES
GESTATIONIS AND OTHER SIMILAR
FORMS OF DISEASE.¹

BY LOUIS A. DUHRING, M.D.,

PROFESSOR OF SKIN DISEASES IN THE UNIVERSITY OF PENNSYLVANIA.

IN my original communication on Dermatitis Herpetiformis,² the symptoms, characteristics, and the several varieties of the disease were described. It was also stated that the pustular variety was the same manifestation as that described by Hebra as impetigo herpetiformis. The view was likewise put forth that the herpes gestationis of authors was probably merely another variety of this affection. In a more recent paper, just read before this Association,³ the relation of the impetigo herpetiformis of Hebra to dermatitis herpetiformis has been shown, and the conclusion reached that the former is but a variety of the latter disease. In the present note I desire to bring forwards supplementary views which have of late been forced upon me by study of the literature of the subject, to the effect that not only the herpes gestationis of writers, but also other similar forms of eruption reported with various titles are

all merely instances of one process, namely, dermatitis herpetiformis as I have defined this disease.

To be more definite, some of these cases may be mentioned.

The "herpes circinatus bullosus" of Erasmus Wilson;¹ the "pemphigus prurigineux" of Hardy;² the "herpes gestationis" of Milton,³ Bulkley,⁴ Thompson,⁵ Liveing,⁶ Cottle,⁷ Gale,⁸ and W. G. Smith,⁹ all represent manifestly the same disease, and are expressions of the vesicular and bullous varieties of dermatitis herpetiformis. In like manner the "pemphigus" of Klein;¹⁰ the "pemphigus circinatus," of Rayer;¹¹ the "herpes phlyctænodes" of Gibert;¹² the "pemphigus aigu pruriginosus" of Chausit,¹³ and the "pemphigus composé" of Devergie.¹⁴ Certain cases of so-called "hydroa," should, I think, also be viewed as forms of dermatitis herpetiformis, as, for example, the cases reported by Handfield Jones¹⁵ and Bulkley,¹⁶ and that of "Florence S.,"

described in the *British Medical Journal*, 1870. Likewise such cases as that of Oswald,¹ reported with the heading "a peculiar skin eruption occurring during pregnancy;" and of Leigh,² a "bulous eruption of a peculiar character."

The very unusual case of Jarisch,³ designated "herpes iris," and the case of Meyer,⁴ "a fatal pemphigus-like dermatitis," have also points in common with the disease under consideration.

Finally, without doubt some cases of so-called pemphigus, especially of "pemphigus pruriginosus," might more properly be regarded as examples of dermatitis herpetiformis.

1961. Journal, mostly, about our differences
than disagreements. On the other side, there were many mutual
affectionate feelings while working out "genuine and
spiritualized" (as Edith had it) "common ground".

Edith's "inner life" was very much
interested in her own personal growth and
that of others. In many ways, she was "spiritual"
and "mystical" because she had "spiritual" experiences
and "mystical" feelings. She had a "spiritual" life and a "mystical" life.
She was also "spiritual" because she had a "spiritual" attitude
towards life, towards others, towards creation, towards
the "spiritual" and "mystical" aspects of life.

Edith's "inner life" was also "mystical" because
she had "mystical" experiences and "mystical" feelings.
She was also "mystical" because she had a "mystical" attitude
towards life, towards others, towards creation, towards
the "mystical" aspects of life.

Edith's "inner life" was also "spiritual" because
she had "spiritual" experiences and "spiritual" feelings.
She was also "spiritual" because she had a "spiritual" attitude
towards life, towards others, towards creation, towards
the "spiritual" aspects of life.
